1 Trailing arms

General

BPW trailing arms

The trailing arm connects the axle to the vehicle frame via air suspension hanger brackets and the air bag.

BPW trailing arms (single or twin leaf) are highly flexible spring steel elements. They are hot-rolled from one piece, after which they are shot-peened and CDP_{ZN}-coated.

Trailing arms largely absorb the bending moments and reduce the torsional forces input into the axle beam.

Various trailing arm versions permit optimisation of axle load, track, spring centre, centre of gravity height and driving comfort.

In every situation their stiffness and flexibility are exactly matched to the vehicle and its application.

This reduces the stress on the body and ensures that the vehicle achieves a long service life.

If single leaf trailing arms are used the locking plate offers the necessary safety reserves if the worst should come to the worst.

Long-life steel / rubber / steel bushes (up to 4 times the service life of rubber / steel bushes) offer maintenance-free mounting of the trailing arm.

The axle is precisely located, and tyre wear and operational costs are both reduced.

Spare parts for ECO Air (EA) air suspensions see Chap. 11.

Spare parts for ECO Air COMPACT (AC) air suspensions see Chap. 12.

Trailing arms 1

General

Conversion of spring bolts

As part of introducing new products into series production, the spring bolt gland on all Airlight II air suspension systems was changed from **M 30** to **M 24** from September 2007 onwards.

Introducing a more elastic **M 24** spring bolt gland provides greater security due to higher bolt tension being achieved.

This means the bolted connection has been made even less susceptible to settling.

In addition, **M 24** spring bolts are Geomet coated. This eliminates the need for additional lubrication.

This modification affects all air suspension systems with 70 mm wide trailing arms (all Airlight II versions).

All the versions were converted to **M 24** at the start of series production from week 36 / 2007 onwards. Versions with **M 30** spring bolts were not produced from that point onwards.

The adaptation to **M 24** spring bolts is performed by changing the spring pivot bolt assemblies, the bushes in the air suspension hanger brackets and channel cross members and the steel / rubber / steel bushes in the trailing arms.

The geometry of the actual trailing arm is not changed. As an assembly, the trailing arms with steel / rubber / steel bushes for **M 24** spring bolts are given the index 2 (example: trailing arm 05.082.13.88.0 for **M 30** spring bolt => trailing arm 05.082.13.88.2 for **M 24** spring bolt). It is possible to adapt from the **M 30** spring bolt to the **M 24** spring bolt by changing the steel / rubber / steel bush.

With all SL air suspensions, the spring bolt gland will be successively changed over from **M 30** to **M 30 x 2** from spring 2019 onwards.

The introduction of a **M 30 x 2** spring bolt causes the preload to increase while the tightening torque remains constant.

SL versions with **M 30** spring bolts were not produced from that time onwards.

The conversion to the new spring bolts **M 30 x 2** is achieved by means of a modified or new spring bolt part groups incl. new nuts.

1 Trailing arms

General

Optimised trailing arm and air bag attachment

As part of a further development of the Airlight II air suspension, BPW introduced new optimised trailing arms from 01 July 2010, as well as a centrally bolted air bag BPW 30 / 30 K for offset $V = 20$ mm.

A four-hole pattern was drilled into the new trailing arm and the air bag was bolted directly onto the trailing arm with a single bolt.

In addition to the new centrally bolted air bag, the familiar air bags BPW 30 / 30 K and BPW 36 / 36 K / 36-1 can continue to be attached using a steel plate and different offsets.

Note: Please note that the new air bag can only be combined with the new trailing arm.

The bolt/hole diameters prevent the new air bag from being attached to an old trailing arm by mistake.

From a technical point of view, there are no restrictions for using both versions on the same axle or vehicle.

Old version	New version
	Drilling pattern for the old air bag  Drilling pattern for the new air bag

Trailing arms 1

General

Determining replacement trailing arms

The BPW code number is embossed into the underside of the trailing arm (around the air bag screwed joint) or around the rolled-in spring eye of the trailing arm.

If this identification is missing or no longer legible, the particular type of trailing arm can be determined based on the shape and the dimensions.

1. Clarifying the version

- ⊙ Single leaf, 3D trailing arm or double leaf trailing arm
- ⊙ Spring bolt $\varnothing 24$ or $\varnothing 30$
- ⊙ Note the position of the spring bolt in double leaf trailing arms
- ⊙ Measure the thickness (**D**) of the trailing arm and the width (**B**)
- ⊙ Determine the offset (**K**) and the shape (**BH**)
- ⊙ Measure dimension **L1** (middle of spring bolt to middle of axle)
- ⊙ Measure dimensions **L2** to **L5**

Trailing arms with rubber / steel bushes fitted are no longer available. If there is a requirement for replacing them, change to trailing arms with steel / rubber / steel bushes!

Rubber / steel bushes cannot be replaced by steel / rubber / steel bushes!

Trailing arms with catch plate fitted (secured by a centre bolt) are replaced by trailing arms with a loose catch plate.

When changing to trailing arms with loose catch plate, use tracking plate or pin. See also Chap. 2.4.

2 Axle plates, spring seat arrangements

General

BPW spring seat arrangements

The axle is connected to the trailing arm using the **spring seat arrangement** comprising: spring plates, spring pads, if necessary segments and spring U-bolts.

Clamped, positive-locking spring seat arrangements ensure an even force transfer into the axle proportional to the degree of load. This is possible with round and square axle beams which therefore offer a long service life.

In the case of square axle beams, the supports are attached at the reinforced corners of the axle beam (no welded connection).

In the case of round axle beams, a patented high-tech laser process ensures a secure fit and the greatest possible robustness for the spring seat arrangement.

The modular construction guarantees a service-friendly repair.

Welded spring seat arrangements are mainly used with a round axle cross section, steering axles as well as heavy-duty air suspension systems.

As a load-bearing component of the suspension unit, the trailing arm requires particular attention.

The following instructions should be carefully adhered to during repair and maintenance work:

- ⊙ **Do not work on trailing arms with a hammer or any sharp objects.**
- ⊙ **Do not work on the trailing arms with cutters or grinders.**
The guide bed should always be widened if replacement trailing arms do not fit exactly into the bed of the axle spring seats.

Spare parts for ECO Air (EA) air suspensions see Chap. 11.

Spare parts for ECO Air COMPACT (AC) air suspensions see Chap. 12.

Axle plates, spring seat arrangements

2

General

Determining spring seat arrangements

Clarifying the version

- ⊙ Trailing arm 70 mm or 100 mm wide
- ⊙ Axle cross section $\varnothing 127$ / $\varnothing 146$ / $\square 120$ / $\square 150$
- ⊙ Spring seat arrangement, clamped or welded
- ⊙ Round centering ring or square frame with clamped square spring seat arrangement
- ⊙ Axle plates with centering cone
- ⊙ Shock absorber attachment:
 - ⊙ Axle plates without shock absorber attachment
 - ⊙ Axle plates with welded bolt for shock absorber attachment or spring plate for shock absorber attachment
- ⊙ Trailing arms mounted above or below
- ⊙ Spring U-bolts or hexagon screws
- ⊙ Spring U-bolt encloses axle beam or is positioned to the side
- ⊙ Spring U-bolts or screws mounted above or below
- ⊙ Single or double segments

Tracking plates

Weld tracking plates after installation and tracking at the rear end of the spring plates or axle plates – weld a 4 $\triangle$ x 80.

 **Do not weld the trailing arms!**

Follow the welding guidelines given in the BPW installation instructions!

 **Important for all welding work!**

The trailing arms, spring U-bolts, air bags, shock absorbers and plastic lines must be protected against flying sparks and weld spatter during all welding work.

Under no circumstances must the earth terminal be attached to the trailing arm or hub.

Notes

2 Spring seat arrangements

2.6 Assembly instructions for clamped axle spring seat arrangements

Trailing arms 70 mm wide (AL II), spring U-bolts M 2

ALO / ALM series - Square axle beam

ALO / ALM series - Round tube axle beam Ø 146

Assembly instructions:

- ⊙ Assemble components according to the adjacent illustration, grease spring U-bolts beforehand.
- ⊙ Axle plates and trailing arms are to be aligned parallel to the axle beam and the lock nuts are to be tightened down diagonally and equally.
- ⊙ Control parallel position of axle plates and trailing arms towards the axle beam and tighten self-locking nuts diagonally in a.m. sequence 1-2-3-4 until all have achieved a tightening torque of 200 Nm.

Using a torque wrench tighten self-locking nuts diagonally in following steps to the tightening torque of 550 Nm:

- 1) 200 Nm s.a.
- 2) 300 Nm
- 3) 450 Nm
- 4) 550 Nm

- ⊙ As the last step, turn all lock nuts through a further 90°.

M = 550 Nm + 90°

ALU series

Spring seat arrangements 2

Assembly instructions for clamped spring seat arrangements 2.6

Trailing arms 100 mm wide (SL / AL), spring U-bolts M 24

SLO / SLM / ALO / ALM series

Spring U-bolt encloses the axle beam

Spring U-bolt next to the axle beam

SLU / ALU series

Assembly instructions:

- ⊙ Assemble components according to the adjacent illustration, grease spring U-bolts beforehand.
- ⊙ Axle plates and trailing arms are to be aligned parallel to the axle beam and the lock nuts are to be tightened down diagonally and equally until all components are in uniform contact (the spring seats are only in contact with the radius of the axle beam).
There must be no uneven tensioning due to one-sided tightening of the lock nuts.
- ⊙ Using a torque wrench, tighten the lock nuts in several stages diagonally until the specified tightening torque has been reached.

M = 650 Nm (605 - 715 Nm)

3 Spring pivot bolt bearings

General

Spring pivot bolt bearings

BPW Spring pivot bolt bearings connect the trailing arms to the hanger bracket / frame.

The maintenance-free steel / rubber / steel bushes guarantee that the axles are guided securely and with a stable track under all conditions.

In axle lift devices, the mounting of the lifting arm is integrated into the spring pivot bolt bearing, thereby ensuring a safe and long-life function.

Rapid axle alignment is possible using BPW hanger brackets with integrated track adjustment: Without having to loosen the spring U-bolt, production tolerances on the vehicle can be equalised or wheelbases corrected (axle tracking).

Spring bolt with square torsion protection

Since 1995, BPW has been using spring bolts and weld-in bushes with square torsion protection on rigid steel supports.

In case of wear on bushes with a slot for the hexagon head of the spring bolt that are welded into older supports, change over to the new technology with square torsion protection (see Chap. 7.2.1).

Spare parts for ECO Air (EA) air suspensions see Chap. 11.

Spare parts for ECO Air COMPACT (AC) air suspensions see Chap. 12.

Spring pivot bolt bearings 3

General

Spring pivot bolt bearing from week 18/2004 onwards

From week 18/2004 onwards, the functional principle of the loose wearing plates familiar in Airlight II hanger brackets was also be carried across to the rigid air suspension hanger brackets for 100 mm wide trailing arms.

Loose wearing plates offer the following advantages:

- ☉ Simplified mounting, because the wearing plates are not inserted in the hanger bracket until the trailing arm has been positioned in the bracket.
This means there is significantly more installation space available at the start of the installation procedure.
Preinstalled air suspension modules can therefore be installed in the vehicle frame much easier thanks to the hanger brackets which are already welded on.
- ☉ A practical design of the wearing plates thanks to the insertion offset and height limitation ensures that the installation proceeds smoothly.
- ☉ Mixed installation is technically possible (hanger brackets with loose wearing plates or with welded wearing plates).

Wearing plates

BPW uses two different versions of wearing plates.

1. A straight shaped plate for straight hanger brackets, channel cross members and frames
BPW Code no.: 03.164.35.04.0 - M 24
03.164.35.01.0 - M 30
2. An offset shaped plate for angled hanger brackets
BPW Code no.: 03.164.35.03.0 - M 24
03.164.35.02.0 - M 30

Spring bolt Ø 24 mm (AL series)

Since week 30/2007 BPW air suspension kits (Airlight II) were only available with Ø 24 mm trailing arm bushes and spring bolts.

Introducing an **M 24** spring bolt provides greater security due to higher bolt tension being achieved while increasing the contact surfaces within the screwed joint.

The tightening torque is reduced from **900 Nm** (840 - 990 Nm) for the **M 30** spring bolt to **650 Nm** (605 - 715 Nm) for the **M 24** spring bolt.

Spring bolt Ø 30 (SL series)

From spring 2019, the spring bolt gland on BPW air suspension kits in series SL will be changed over from **M 30** to **M 30 x 2**.

The introduction of a **M 30 x 2** spring bolt causes the preload to increase while the tightening torque remains constant.

* **Important: Always change the lock nuts in case of replacement!**

Spring bolt and lock nuts are successively being converted to fine thread.

Spring bolt 03.341.05.08.0 Replacement for 03.341.05.03.0 (M 30 x 200 / Ø 52)

Spring bolt 03.341.05.09.0 Replacement for 03.341.05.04.0 (M 30 x 200 / Ø 62)

Spring bolt 03.340.15.46.0 or 03.340.15.48.0 Replacement for 03.340.15.37.0 (M 30 x 265 / SW 46)

Spare parts for ECO Air (EA) air suspensions see Chap. 11.

Spare parts for ECO Air COMPACT (AC) air suspensions see Chap. 12.

4 BPW Air bags

General

Standard air bag

BPW air bags are firmly rolled into the top air bag cover and are bonded onto the clamping plate at the bottom by vulcanisation.

The top air bag cover is either bolted onto the frame trussing or a plate or packer is welded onto the vehicle frame to attach the bag, depending on the bag version. The top air bag cover plate is secured by two M 12 lock nuts.

The rolling piston is made from glass-fibre reinforced plastic (GRP) with a steel support to reduce the weight and ensure corrosion resistance. The integrated bumper protects against damage when the bags are vented.

The lower air bag plate is bolted onto the trailing arm using two M 16 locking screws.

BPW Air bags 4

General

Reduced weight of the Airlight II air suspension with the new air bag 30 / 30 K

As part of a further development of the Airlight II air suspension, BPW introduced new optimised trailing arms from 01 July 2010, as well as a centrally bolted air bag BPW 30 / 30 K for offset $V = 20$ mm.

Currently, the air bag is fastened to the trailing arm by means of a universal steel plate inserted into the base of the air bag piston with possible offsets 0 / 20 / 60. This steel plate is attached to the trailing arm with two screws.

In future, the air bag will be bolted directly to the trailing arm with just a single screw and using the most common standard offset of $V = 20$ mm. A four-hole pattern will be drilled into the new trailing arm. In addition to the new centrally bolted air bag, the familiar air bags BPW 30 / 30 K and BPW 36 / 36 K / 36-1 can continue to be attached using a steel plate and different offsets.

The new centrally bolted air bag saves a total of 15 kg on a 3-axle unit (5 kg per module) compared to the previous version.

Note: Please note that the new air bag can only be combined with the new trailing arm.

The bolt/hole diameters prevent the new air bag from being attached to an old trailing arm by mistake.

However, the old bag with the steel plate can continue to be used for all versions with old or new springs.

From a technical point of view, there are no restrictions for using both versions on the same axle or vehicle.

Your sales contact will be happy to assist you when planning the conversion.

4 BPW Air bags

General

Split air bag (Combi Air bag)

A Combi Air bag is divided into two parts: The air bag is bolted onto the vehicle frame with the rolling piston while the centering cone is connected to the trailing arm or integrated to the axle plates. If the vehicle is lifted, the axle and the cone move downwards.

The movement is restricted by the shock absorbers.

However, the air bag remains in its rest position.

If the vehicle is lowered to the ground, the air bag and centering cone come together once more.

The bag can neither fold nor crease.

Stroke limitation

The upward travel is restricted by a bumper inside the air bag. The downward travel must be restricted under certain operating conditions.

Air supply

The pressure needed during driving is applied via a compressed air line that is connected to the air bag via the threaded sleeve (M 22 x 1.5) welded into the air bag cover or via a stud bolt (M 18 x 1.5 / M 20 x 1.5).

BPW Air bags 4

General

Determining replacement air bags

1. Clarifying the version

- Standard air bag or split air bag (Combi Air bag)

Ø 300	BPW 30	for stroke 200 mm
	BPW 30 K	for stroke 180 mm
Ø 360	BPW 36	for stroke 200 mm
	BPW 36 K	for stroke 180 mm
	BPW 36-1	for stroke up to 340 mm
	BPW 36-2	for stroke up to 450 mm
	BPW 36-5	for stroke up to 380 mm

The air bag design type and BPW code no. of the bare air bag can be read from each air bag.

2. Determining the type of air connection

- Air connection on welded threaded sleeve in the air bag or hollow stud bolt.

3. Air bag attachment

- Top air bag attachment in middle of bag or offset to the side?
- Measure the position of the top air bag attachment on the frame in relation to the bottom air bag attachment on the trailing arm (the maximum lateral offset between the top and bottom air bag attachment is not allowed to exceed 10 mm).
The top and bottom air bag attachments must not be installed with any rotational misalignment!
- Bottom attachment with 2 locking screws or one central screw?

4. Old version of air bags

Complete air bags of the older version, air bags with aluminium pistons and internal aluminium support as well as split bags with glass fibre reinforced plastic taper (BPW 36) are no longer available.

If replacement is required, convert to BPW air bags with GRP piston.

The most common spare parts for older air bags with steel piston are still available.

4 BPW Air bags

4.2 Conversion to air bags with GRP pistons

Conversion from air bags with steel or aluminium pistons

Air bag with steel or aluminium piston

Air bag with GRP piston

Types BPW 30 / 30 K / 36 and 36 K air bags with steel or aluminium pistons are no longer available in some cases.

If replacement is required, change over to the air bag with GRP piston.

Observe position of lower attachment plate – upper air bag attachment!

Disassembly:

- ⊙ Inflate air bags as much as possible using the rotary slide valve/change-over valve.
- ⊙ Support the vehicle to prevent accidents, e.g. place a suitable distance piece between the vehicle frame and trailing arm.
- ⊙ Vent the air bag.
- ⊙ Remove the compressed air connection.
- ⊙ Unscrew upper (1240) and lower (1224) air bag attachments and remove the air bag.
- ⊙ Apply compressed air into the hole for the air connection until the bag is completely unrolled.
- ⊙ Unscrew and remove locking screw (1222) and take off bottom washer (1220).
- ⊙ Unscrew and remove the square bolt (1215) with an impact wrench and detach piston (1210) from the air bag.

Assembly:

- ⊙ Screw threaded sleeve (1215) onto the air bag to tightening torque of 130 Nm.
- ⊙ Place lower base plate (1220) into the GRP piston (1210) and screw on loosely using locking screw (1222).
- ⊙ Align the top and bottom bag attachment points relative to one another and tighten locking screw (1222) to a tightening torque of 230 Nm. (the air bag must not be twisted after installation in the vehicle!)
- ⊙ Install the air bag in the vehicle, tighten the top and bottom attachments to the corresponding tightening torque. Make the air connections. Check for leaks.
- ⊙ Inflate the air bag, remove the support.

5 BPW Shock absorbers

General

BPW Shock absorbers

The purpose of shock absorbers is to rapidly reduce the vibrations occurring between the axle and body during driving. This prevents any further yawing of the body and running gear components, and ensures that the tyres maintain optimum roadholding. The purpose of this roadholding is to ensure that the vehicle tracking remains accurate and that the vehicle brakes correctly.

BPW shock absorbers are matched to the vehicle, overall height, installation position and applications. Using the split air bag (Combi-Air bag + Airlight^{Direct}) with air suspensions, the shock absorber is fitted with an end stop in order to avoid any further axle travel.

The rubber bushes of BPW shock absorbers can be replaced (see Chap. 5.2).

Shock absorbers should only be built in and changed per axle. Individual axles can be equipped in different ways within a multi-axle vehicle.

BPW Shock absorbers 5

General

PDC

The BPW PDC (Pneumatic Damping Control) shock absorber improves driving characteristics and comfort – whatever the load. The best damping, better road safety, lower maintenance costs – given all these reasons, you don't need to think long and hard before fitting or retrofitting BPW air suspension kits with PDC.

How it works

The disadvantage with conventional shock absorbers is that their characteristics can only be optimally adapted to one loading condition (usually fully laden). PDC shock absorbers detect the actual loading condition via the air suspension and adapts itself smoothly. This improves driving safety at the same time as reducing the strain on the running gear and the vehicle, in particular when the trailer is empty or only partly laden. PDC shock absorbers are virtually essential in high-value vehicles and when carrying sensitive cargoes. Vehicle maintenance costs are reduced. The cargo and the carriageway are also subjected to fewer shock loads. PDC is connected to the BPW air suspension system and does not require any electronic control systems.

When using PDC shock absorbers, a distance washer as well as shorter lock nuts must be used in each case between support or spring pad and PDC.

7 BPW Air suspension hanger brackets

General

BPW Air suspension hanger brackets

Air suspension hanger brackets transfer all control, braking and acceleration forces from the axle to the vehicle frame.

Short, adjustable BPW air suspension hanger brackets with integrated shock absorber attachments make installation easier, reduces weight and reduces the lateral forces on the vehicle's frame. The vehicle manufacturer benefits from straightforward crossbracing options at the interface between the frame and the hanger bracket.

BPW air suspension hanger brackets are available in steel as well as in stainless steel and aluminium if required.

Complete frames are no longer available.

BPW Channel cross member

Vehicle manufacturers all over the world quickly appreciate the assembly benefits of this module.

Whether it's the hanger brackets, the shock absorber attachments or the cross-braces, everything is integrated to save space. Even steering axles can be connected to it without additional preparation.

The channel cross member is available in two versions – with an open, narrow hanger bracket for welding or with a cover plate for bolting/riveting onto the vehicle frame.

The channel cross member can even make additional cross-members unnecessary, depending on the frame design.

BPW order numbers for channel cross members upon request!

Track alignment

Rapid axle alignment is possible using BPW hanger brackets with integrated track adjustment: Without having to loosen the spring U-bolt, production tolerances on the vehicle can be equalised or wheelbases corrected (axle tracking).

Spare parts for ECO Air (EA) air suspensions see Chap. 11.

Spare parts for ECO Air COMPACT (AC) air suspensions see Chap. 12.

BPW Air suspension hanger brackets 7

General

Greater flexibility for vehicle manufacturers - the bolted Airlight II air suspension hanger brackets from BPW

With the new, innovative bolted Airlight II air suspension hanger brackets, BPW is offering the opportunity of pre-fabricating compact vehicle frames without air suspension hanger brackets, coating them but not attaching the axle and suspension unit until the final assembly stage.

By expanding the Airlight II range, BPW is offering vehicle manufacturers an attractive alternative to the conventional, fully welded chassis. This is because the bolted system offers clear logistical and cost advantages, in particular for off-site frame production and surface coating. Production is made more flexible.

The air suspension hanger brackets are available from week 36/2017 onwards and like all other Airlight II air suspension hanger brackets and channel cross members, they are designed for use with M 24 trailing arm spring bolts from the start of series production (see also BPW News Luft 7122702e).

Customer advantages:

- ⊙ Installation of the entire running gear (incl. bracket struts) by cold-joining technology
- ⊙ Significant cost and logistical advantages with off-site frame production and surface coating (it is easier to transport the vehicle frame without hanger brackets)
- ⊙ Expansion of production flexibility
- ⊙ For mounting on standard frames with bottom flange width as little as 120 mm
- ⊙ No changes to the frame required, except for the hole pattern
- ⊙ Suitable for alu frame
- ⊙ Improved reparability

7 BPW Air suspension hanger brackets

General

Chock absorber fastening

Hanger brackets with welded bolts for shock absorber attachment (100 mm wide trailing arm) replaced by hanger brackets for shock absorber attachments with screws.

Adjustable hanger brackets

Adjustable hanger brackets and channel cross members with weld-in square frame for spring pivot bolt bearing have been replaced by hanger brackets and channel cross members with weld-in slot bush.

If replacement is required, change over to this new version.

From **week 18/2004** onwards, the functional principle of the loose wearing plates familiar in Airlight II hanger brackets was carried across to the rigid air suspension hanger brackets for 100 mm wide trailing arms.

Wearing plates

BPW uses two different versions of wearing plates.

1. A straight shaped plate for straight hanger brackets, channel cross member and frames.

BPW Code 03.164.35.04.0 - M 24
no.:

03.164.35.01.0 - M 30

2. An offset shaped plate for inclined hanger brackets

BPW Code 03.164.35.03.0 - M 24
no.:

03.164.35.02.0 - M 30

It is essential to use new spring bolts when the hanger bracket / channel cross member is replaced!

Observe modified spring pivot bolt bearing!

Spare parts for ECO Air (EA) air suspensions see Chap. 11.

Spare parts for ECO Air COMPACT (AC) air suspensions see Chap. 12.

BPW Air suspension hanger brackets 7

General

Determining replacement air suspension hanger brackets

The BPW code number is embossed into the end of the hanger bracket.

If this identification is missing or no longer legible, the particular type of hanger bracket can be determined based on the shape and the dimensions.

Determining the version

- ⊙ Hanger bracket / channel cross member / frame
- ⊙ Steel, aluminium or stainless steel hanger brackets
- ⊙ Straight box-section hanger bracket / Best-Design hanger bracket / taper mounted hanger bracket
- ⊙ Spring pivot bolt bearing, rigid or adjustable
- ⊙ Spring pivot bolt Ø 24 or Ø 30
- ⊙ Trailing arm 70 or 100 mm wide
- ⊙ Tall hanger bracket (ST)
- ⊙ Hanger bracket with shock absorber fastening (screw/bolt)
- ⊙ Position of shock absorber attachment (D / F)

7 BPW Air suspension hanger brackets

7.2 Spare parts for hanger brackets, channel cross members and frames

7.2.1 Changing the weld-in bushes (spring bolt assembly) in BPW hanger brackets

Changing the weld-in bushes (spring bolt assembly) in BPW air suspension hanger brackets for 100 mm wide trailing arms and loose wear plates

Perform the following work if the mounting bushes are worn out:

1. Remove the worn-out bushes from the side plates
2. Insert new bushes and use spacer sleeve* (112.5) or trailing arm bush (102.5 + 0.5) plus mounted wear plates to preload, align centrally and with adjustable hanger brackets horizontally and tack-weld

3. Weld the bushes
4. When mounting the trailing arms:
 - Lightly grease the stud thread and nut contact surface
 - Mount wear plates
 - Tighten lock nut M 30 to M = 900 Nm (840 – 990 Nm)

Important for all welding work!

The trailing arms, spring U-bolts, air bags, shock absorbers and plastic lines must be protected against flying sparks and weld spatter during all welding work.

Under no circumstances must the earth terminal be attached to the trailing arm or hub.

Welding method:

- ☉ Inert gas welding
Weld wire quality G 4 Si 1 (DIN EN 440)
- ☉ Manual arc welding
Rod electrodes E 46 2 (DIN EN 499)

Mechanical quality values must correspond to the basic material S 420 or S 355 J 2

Seam thickness a 4 Δ to a 5 Δ (DIN EN ISO 25817)

Avoid end craters and undercuts!

7.2

Changing the weld-in bushes (spring bolt assembly) in BPW hanger brackets

7.2.1

Changing the weld-in bushes (spring bolt assembly) in BPW air suspension hanger brackets for 70 mm wide trailing arms and loose wear plates

Perform the following work if the mounting bushes are worn out:

1. Remove the worn-out bushes from the side plates
2. Insert new bushes and use spacer sleeve* (82.5) or trailing arm bush (72 + 0.5) plus mounted wear plates to preload, align centrally and with adjustable hanger brackets horizontally and tack-weld

3. Weld the bushes
4. When mounting the trailing arms:
 - Lightly grease the stud thread and nut contact surface
 - Mount wear plates
 - Lock nut

Tighten M 24 to M = 650 Nm (605 - 715 Nm)

Tighten M 30 to M = 900 Nm (840 - 990 Nm)

Important for all welding work!
The trailing arms, spring U-bolts, air bags, shock absorbers and plastic lines must be protected against flying sparks and weld spatter during all welding work.
Under no circumstances must the earth terminal be attached to the trailing arm or hub.

Welding method:

- ☉ Inert gas welding

10 BPW Axle lift devices

General

BPW Axle lift devices

As an option, multi-axle vehicles can be equipped with an axle lift to reduce the wear on the tyres when driving unladen or with a light cargo. BPW offers axle lifts for positioning in the middle or at the sides of the axle.

Side mounted axle lift

A sidewise mounted lift is recommended for lifting the first axle and in vehicles with limited ground clearance, high axle loads or long suspension travel.

Central mounted axle lift

The lifting device can be arranged in the centre of the axle for lifting the central (rear) suspension axle or if space is limited.

This axle lift device is attached to the frame by cross-members in the middle of the vehicle.

The lift bag forces must also be absorbed by a cross-member.

Spare parts for ECO Air (EA) air suspensions see Chap. 11.

Spare parts for ECO Air COMPACT (AC) air suspensions see Chap. 12.

BPW Axle lift devices 10

General

Central axle lift

Both the central axle lift device using a lifting bag and the BPW central lift with bellows fitted in the middle of the vehicle can lift one or more suspension axles and are integrated within the space of the axle unit.

Their compact design means they are preferred for use in vehicles with limited ground clearance and small tyres (e.g. pallet box trailers with single tyres).

Two-sided lift

The two-sided lift (for air-sprung axles up to 10 tonnes) does not need any space in front of the air suspension hanger brackets or in the middle of the vehicle.

It can be retrofitted at any time to offer the convincing benefits of low weight and good ground clearance.

Spare parts for ECO Air (EA) air suspensions see Chap. 11.
Spare parts for ECO Air COMPACT (AC) air suspensions see Chap. 12.

10 BPW Axle lift devices

10.3 Two-sided axle lifts

10.3.4 Installation instructions

Two-sided axle lift, installation instructions

General

The BPW two-sided axle lift is suitable for the following axles and air suspension systems:

- ⊙ 9 tonnes air suspension axles for single and twin wheels
- ⊙ 10 tonnes air suspension axles with single wheels, not however for axles with greater permitted axle loads or for steering axles
- ⊙ Air suspension systems with air bag types 30K, 30, 36K, 36 for spring deflections up to 220 mm, not however for long-travel air suspension systems with bag types 30-1, 36-1, 36-2, 36-5

The two-sided axle lift is fitted underneath the air suspension hanger brackets of the axle to be lifted. Please bear in mind the following points when using them:

- ⊙ In air suspension systems with raising and lowering, the downward travel of the axles must be limited. The stroke limitation can take the form of an air suspension valve with integrated height limitation, a separate shut-off valve or of catch straps.
The stroke limiting function must be set so that the axle lift cannot be overloaded at maximum lift.
- ⊙ The ride height of the air suspension must be set to a min. upward travel of 100 mm. When the axle is lifted, the tyre damping results in a clearance of approx. 60 mm under the tyres.
- ⊙ Make sure there is adequate ground clearance below the axle lift, in particular in air suspension systems with trailing arms located underneath to give a low vehicle height.
- ⊙ Make sure the right and left sides of one hanger bracket have a symmetrical setting of the sliding blocks.
- ⊙ After mounting the axle lift, check it functions correctly and that there is adequate clearance from the adjacent components.
- ⊙ An air pressure of at least 6 bar is required to lift the axle.
- ⊙ The permitted operating pressure is 8.5 bar.
There is no need for a pressure control valve or a residual pressure holding feature.
Free cylinder venting through cross sections without throttle points in the valve installation must be ensured in order to avoid impermissibly high pressure values.
- ⊙ Comply with the appropriate statutory regulations when retrofitting an axle lift (e.g. overload protection, German „BO-Kraftkreis“, etc.).

BPW Axle lift devices 10

Two-sided axle lifts 10.3

Installation instructions 10.3.4

Two-sided axle lift, installation instructions

Perform the following installation steps when retrofitting the two-sided axle lift:

- ⊙ Take the load off the lifting axle.
- ⊙ Unscrew the spring bolt (M 30) and remove it.
- ⊙ Install the two-sided axle lift as described in the supplied installation instructions. When doing this, only fit the spring bolts loose and do not tighten them yet.
- ⊙ Install the diaphragm cylinder with the air connection upwards (M = 180 Nm).
- ⊙ Fit plastic plugs into the diaphragm cylinder so the bottom hole is open whilst the top hole is tightly closed.
- ⊙ Install the bumper under the air suspension hanger bracket (integrated support) in the position provided for the air suspension (M = 66 Nm). Refer to the technical documents for the air suspension for the corresponding position.

Proceed as follows if you do not have the corresponding technical documents:

- ⊙ Raise the air suspension using the rotary disc valve or by disconnecting the air suspension linkage. Raise it until the air bags are fully extended.
- ⊙ Pivot the axle lift towards the trailing arm by hand, until the plastic buffer makes contact with the trailing arm (the catch plate must be in contact with the trailing arm).
- ⊙ In this position, fit the bump stop so it is in contact with the air suspension hanger bracket (channel cross member).
- ⊙ Adjust the air suspension to the nominal ride height with the rotary disc in the "driving" position.
- ⊙ Fit the spring bolt torsion protection.
- ⊙ Tighten the spring bolt gland to the prescribed tightening torque (M = 650 / 900 Nm).
- ⊙ Refer to the appropriate installation guidelines for the air suspension installation and valve connection.
- ⊙ Perform a trial actuation to test that it is functioning reliably. Do not touch any moving parts of the axle lift when doing this. **RISK OF INJURY!**
- ⊙ Check the spring bolt gland is firmly seated after the first drive under load.

AC

12 BPW ECO Air COMPACT running gear systems

12.2 Two-sided axle lift, ECO Air COMPACT

Two-sided axle lift, ECO Air COMPACT

Item	Designation	Remark	BPW code no.:	Dimension	
			H = 60 mm	H = 60 mm	H = 130 mm
1600	Two-sided axle lift cpl. Item 1610 - 1660		05.828.32.05.0	H = 60	05.828.32.06.0 H = 130
1610	Support		03.189.15.98.0		
1613	Shaped plate		03.165.46.62.0		
			- 09 / 2015		
1621	Bolt *		03.084.12.05.0	Ø 12 / Ø 20 x 155	
1623	Locking washer		02.5413.10.93		
			09 / 2015 -		
1621	Bolt		03.084.12.06.0	Ø 12 / M 10 x 163 / SW 16	
1623	Lock nut		02.5273.28.87	M 10	
1635	Locking screw		02.5071.59.11	M 12 x 22 / SW 17	
1636	Lock nut		02.5273.33.80	M 12 - 10 / SW 17	
1639	Repair kit formed part Item 1640 - 1644		09.801.08.13.0	for 1 axle side	09.801.08.24.0 for 1 axle side
1640	Shaped part		03.001.35.17.0	for H = 60	03.001.35.19.0 for H = 130
1642	Dowel		02.0130.87.10	M 10	
1643	Washer		02.5401.10.11	A 10	
1644	Cylinder cap screw		02.5015.27.82	M 10 x 50 / SW 8	
1660	Lift cylinder incl. item 1663		05.444.10.41.0		
1663	Hexagon nut		02.5202.21.80	M 16 x 1.5 / SW 24	

* Replaced by bolt with lock nut

BPW ECO Air COMPACT running gear systems 12

Sidewise mounted axle lift, ECO Air COMPACT 12.3

Sidewise mounted axle lift, ECO Air COMPACT

Item	Designation	Remark	BPW code no.:	Dimension	BPW code no.:	Dimension

1678	Lock nut		02.5220.50.82	M 20	03.260.03.12.0	M 20 / SW 30

12 BPW ECO Air COMPACT running gear systems

12.4 Central axle lift device, ECO Air COMPACT

Central axle lift device, ECO Air COMPACT

Item	Designation	Remark	BPW code no.:	Dimension
1154	Screw (spring bolt)		03.340.15.37.0 *	M 30 x 265 / SW 46
			03.340.15.46.0	M 30 x 2 x 265 / SW 46
			03.340.15.48.0	M 30 x 2 x 273 / SW 46
1165	Washer		02.5401.31.01	A 31 / 125
1168	Lock nut		03.260.15.01.0 *	M 30 / SW 46
			03.260.15.02.0	M 30 x 2 / SW 46
1175	Bush		03.113.94.10.0	Ø 41 / 50 x 23
1180	Graduated bush		03.113.01.47.0	Ø 30 / 40 / 62 x 31
1200	Air bag incl. item 1224		see Chap. 4	
1224	Locking screw		02.5070.95.00	M 16 x 65
1225	Hexagon screw		02.5026.35.12	M 16 x 45 - 10.9
1510	Hanger brackets		see Chap. 7	
1600	Support		05.189.10.31.0	
1605	Tube		03.310.74.22.0	Ø 35 / 51 x 112
1610	Lifting arm		03.195.00.96.0	L = 720 mm
1615	Support		05.189.13.19.0	146 x 176
1625	Bumper		02.3506.02.00	Ø 80 / M 12

*** Important: Always change the lock nuts in case of replacement!**

Spring bolt and lock nuts are successively being converted to fine thread.

Spring bolt 03.340.15.46.0 or 03.340.15.48.0 Replacement for 03.340.15.37.0 (M 30 x 265 / SW 46)

Lock nut 03.260.15.02.0 Replacement for 03.260.15.01.0

Notes

BPW ist ein weltweit führender Hersteller von intelligenten Fahrwerksystemen für Anhänger und Auflieger. Von der Achse über Federung und Bremse bis hin zu anwenderfreundlichen Telematikanwendungen bieten wir als Mobilitätspartner und Systempartner Lösungen für die Transportindustrie aus einer Hand.

Damit schaffen wir höchste Transparenz in Verlade- und Transportprozessen und ermöglichen ein effizientes Flottenmanagement. Hinter der traditionsbewussten Marke für Trailerachsen steckt heute eine internationale Unternehmensgruppe mit einem breiten Produkt- und Dienstleistungsportfolio für die Nutzfahrzeugindustrie. Mit Fahrwerksystemen, Telematik, Beleuchtungssystemen, Kunststofftechnologie und Aufbautentechnik ist BPW der Systempartner für Fahrzeughersteller.

Dabei verfolgt BPW als inhabergeführtes Unternehmen konsequent ein Ziel: Ihnen immer genau die Lösung zu bieten, die sich am Ende für Sie auszahlt. Dafür setzen wir auf kompromisslose Qualität für hohe Zuverlässigkeit und Lebensdauer, gewichts- und zeitsparende Konzepte für geringere Betriebs- und Wartungskosten sowie persönlichen Kundendienst und ein dichtes Servicenetz für schnelle und direkte Unterstützung. So können Sie sicher sein, mit Ihrem Mobilitätspartner BPW immer den wirtschaftlichen Weg zu gehen.

Your partner on the way to economic viability!
